DATE MAILED: 06/08/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No. 09/707,900	Applicant(s) NOH ET AL.	
	Examiner Michael C. Wilson	Art Unit 1632	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 13 April 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-5 and 13-15 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-5 and 13-15 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 4-13-06 has been entered.

Claims 1-5 and 13-15 remain pending and under consideration.

Priority

Examples III-VI are new in this application (pages 23-25). Example VI is not in parent application 09/702718. The effective filing date of the instant application is 11-8-00.

Information Disclosure Statement

The IDS filed 2-2-05 was considered in the previous office action sent 4-13-05; however, if applicants believe any of the 54 references are particularly relevant to the claimed invention, please point to such references more specifically.

Claim Rejections - 35 USC 112 - new matter

Claims 1-5 and 13-15 remain rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention for reasons of record.

The limitation of treating osteoarthritis with chondrocytes transfected with TGF- β 1 or BMP resulting in regenerating connective tissue remains new matter (claims 1 and 13).

Pg 5, lines 14-23, teaches:

"The present invention is also directed to a method of regenerating hyaline cartilage, comprising:

- a) generating a recombinant viral or plasmid vector comprising a DNA sequence encoding a member of a transforming growth factor superfamily of proteins operatively linked to a promoter;
- b) transfecting in vitro a population of cultured connective tissue cells with the recombinant vector, resulting in a population of transfected connective tissue cells; and
- c) transplanting the transfected connective tissue cells by intraarticular injection to joint space of a mammalian host, such that expression of the DNA sequence within the joint space results in regenerating hyaline cartilage."

Pg 5, line 5 and pg 9, line 6, teach the connective tissue cells can be chondrocytes.

Pg 13, lines 1-2, teaches injecting transfected connective tissue cells into the joint to express exogenous TGF superfamily proteins in the joint space.

Pg 5, lines 11-12, teach the TGF superfamily proteins include TGF- β 1 and BMP.

Applicants point to page 1, lines 17-24, which states:

"In the orthopedic field, degenerative arthritis or osteoarthritis is the most frequently encountered disease associated with cartilage damage. Almost every joint in the body, such as the knee, the hip, the shoulder, and even the wrist, is affected. The pathogenesis of this disease is the degeneration of hyaline articular cartilage (Mankin et al, J Bone Joint Surg, 52A: 460-466, 1982). The hyaline cartilage of the joint becomes deformed, fibrillated, and eventually excavated. If the degenerated cartilage could somehow be regenerated, most patients would be able to enjoy their lives without debilitating pain. There has been no method reported to date to regenerate damaged hyaline cartilage."

Thus, pg 1, lines 17-24, is limited to regenerating hyaline cartilage not connective tissue as broadly claimed. Therefore, the specification as originally filed did not contemplate regenerating any connective tissue when treating osteoarthritis.

The rejection regarding "transfected/transduced" has been withdrawn in view of the amendment. Transfected connective tissue cells are described on pg 5, line 21.

In the previous claim set (filed 7-30-02), only claims 13-15 were limited to transplanting cells without scaffolding because the official clean copy of claim 1 filed 7-30-02 did not have the phrase "without scaffolding" (despite the fact that the marked up version of claim 1 filed 7-30-02 did have the phrase "without scaffolding").

The limitation of "without scaffolding" (now in both claims 1 and 13) is supported on pg 12, lines 17-31, which states: "It is to be understood that while it is possible that substances such as a scaffolding or a gamework as well as various extraneous tissues may be implanted together in the gene therapy protocol of the present invention, it is preferred that such scaffolding or tissue not be included in the injection system of the invention."

Claim Rejections - 35 USC 112 - enablement

Claims 1-5 and 13-15 remain rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for transfecting fibroblasts with DNA encoding TGF- β 1 operably linked to a promoter, transplanting the transfected fibroblasts into a joint space of a mammal such that expression of TGF- β 1 occurs resulting in generating hyaline cartilage, does not reasonably provide enablement for

using chondrocytes encoding TGF- β 1 or BMP to treat arthritis or regenerate any connective tissue as broadly claimed. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention commensurate in scope with these claims for reasons of record.

The specific combination of vector, cell and modes of delivery required to target a desired tissue and regenerate tissue *in vivo* is unpredictable. Miller (1995, FASEB J., Vol. 9, pages 190-199) review the types of vectors available for *in vivo* gene therapy, and conclude that "for the long-term success as well as the widespread applicability of human gene therapy, there will have to be advances...targeting strategies outlined in this review, which are currently only at the experimental level, will have to be translated into components of safe and highly efficient delivery systems" (page 198, column 1). Deonarain (1998, Expert Opin. Ther. Pat., Vol. 8, pages 53-69) indicate that one of the biggest problems hampering successful gene therapy is the "ability to target a gene to a significant population of cells and express it at adequate levels for a long enough period of time" (page 53, first paragraph). Deonarain reviews new techniques under experimentation in the art that show promise but states that such techniques are even less efficient than viral gene delivery (see page 65, first paragraph under Conclusion section). Verma (Sept. 1997, Nature, Vol. 389, pages 239-242) reviews vectors known in the art for use in gene therapy and discusses problems associated with each type of vector. The teachings of Verma indicate a resolution to vector targeting has not been achieved in the art (see entire article). Verma also teaches appropriate regulatory

Art Unit: 1632

elements may improve expression, but it is unpredictable what tissues such regulatory elements target (page 240, sentence bridging columns 2 and 3). Crystal (1995, Science, Vol. 270, page 404-410) also reviews various vectors known in the art and indicates, "among the design hurdles for all vectors are the need to increase the efficiency of gene transfer, to increase target specificity and to enable the transferred gene to be regulated" (page 409).

More specifically, at the time of filing Naughton taught transplanting foreskin fibroblasts to a site of cartilage damage in the presence of scaffolding and regenerating cartilage, suggested transfecting the cells with a vector encoding TGF- β 1 and suggested delivering the cells intraarticularly (Naughton, claim 1; col. 10, line 58; col. 4, line 65; col. 13, line 60 - col. 16, line 33; col. 2, line 56 and col. 18, lines 8-42 which discusses administering the cells to joints that have damaged cartilage). Ikeda taught administering a vector encoding TGF- β 1 intraarticularly to obtain TGF- β 1 expression (pg 1667, col. 1, third paragraph; pg 1669, col. 2). van Beuningen taught TGF- β 1 administered intraarticularly generates articular cartilage (pg 307, col. 1, "intraarticular injections"; pg 308, col. 1, "stimulation of articular cartilage"). The art did not teach how to use fibroblasts or TGF- β 1 to regenerate ligaments or tendons. The art did not teach how to use BMP to regenerate cartilage. The art did not teach how to use osteoblasts or chondrocytes to regenerate cartilage or any other connective tissue.

The specification does not enable using the instant invention to treat osteoarthritis (claim 1). Arthritis in humans causes a diverse T-cell population response against not just collagen or one antigen, but a large number of undefined antigens in the

arthritic joint (Fox et al., July 1995, Am. J. Med., Vol. 99, pgs 82-88; pg 87, col. 1, paragraph 1; pg 84, col. 4, para. 1). The specification demonstrates the invention in rabbits having cartilage defects made with a knife (pg 29, line 7). These rabbits are not art-accepted models for osteoarthritis; nor do the rabbits correlate to osteoarthritis. While arthritic joints require cartilage regeneration, removing cartilage with a knife does not reflect the complex immune response in an arthritic joint. The specification does not teach how damaging cartilage with a knife reflects the diverse T-cell response against the undefined antigens in the arthritic joint as taught by Fox et al. The specification does not provide adequate guidance to regenerate cartilage in an arthritic joint because the cells administered may be attacked by the immune system and may not target the damaged area of cartilage.

The specification does not enable using chondrocytes transfected with DNA encoding TGF- β 1 or BMP to regenerate cartilage or connective tissue. Specifically, the specification does not correlate the results obtained using TGF- β 1 to BMP-2, -3, -4, -5, -6 or -7 such that cartilage would be regenerated. Nor does the specification correlate the function of TGF- β 1 to BMP-2, -3, -4, -5, -6 or -7 such that cartilage could be regenerated. While the specification suggests using BMP (page 11, line 9), the activities and functions of TGF- β 1 and BMPs vary. The specification does not provide the structural features or functional activity of any BMP required to regenerate cartilage or any other connective tissue. The specification does not correlate the results obtained using fibroblasts to chondrocytes. The specification does not correlate the structure or function of fibroblasts and chondrocytes. Without such guidance, it would require one of

skill undue experimentation to use different cells and DNA to regenerate connective tissue in view of the state of the art at the time of filing which only taught fibroblasts encoding TGF- β 1.

Given the unpredictability in the art taken with the guidance provided in the specification, it would have required one of skill undue experimentation to use chondrocytes transfected with DNA encoding TGF- β 1 or BMP to regenerate hyaline cartilage or any desired connective tissue as broadly claimed.

Applicants argue the specification discusses on pg 1, lines 17-24, and injecting transfected fibroblasts into the knee (pg 21, line 20-25; pg 29, line 7); therefore, applicants' conclude applicants enable treating osteoarthritis. Applicants' argument is not persuasive. These rabbits are not art-accepted models for osteoarthritis; nor do the rabbits correlate to osteoarthritis. Removing cartilage with a knife does not reflect the complex immune response in an arthritic joint or the diverse T-cell response against the undefined antigens in the arthritic joint as taught by Fox cited above.

Applicants have not addressed the rejection regarding using chondrocytes instead of fibroblasts. While the specification lists connective tissue cells as including chondrocytes, the specification does not correlate the results obtained using transfected fibroblasts to transfected chondrocytes such that cartilage would be regenerated. The structures and functions of fibroblasts and chondrocytes are materially distinct and separate. The specification does not establish chondrocytes provide the same affinity or amount of expression as fibroblasts. Therefore, the teachings in the specification do not overcome the unpredictability in the art at the time of filing regarding gene therapy

Art Unit: 1632

for those of skill to determine that a therapeutic effect will occur if the transfected fibroblasts used on pg 21, lines 21-25, are replaced with chondrocytes as claimed.

Applicants have not addressed the rejection regarding using chondrocytes encoding exogenous BMPs. The specification does not correlate the results obtained using TGF- β 1 to BMP-2, -3, -4, -5, -6 or -7 or the function of TGF- β 1 to BMP-2, -3, -4, -5, -6 or -7 such that cartilage could be regenerated. While the specification suggests using BMP (page 11, line 9), the activities and functions of TGF- β 1 and BMPs vary. Therefore, the teachings in the specification do not overcome the unpredictability in the art at the time of filing regarding gene therapy for those of skill to determine that a therapeutic effect will occur if the fibroblasts transfected with TGF- β 1 used on pg 21, lines 21-25, are replaced with fibroblasts transfected with BMP-2, -3, -4, -5, -6 or -7.

Claim Rejections - 35 USC 112 - indefiniteness

Claims 1-5 and 13-15 remain rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention for reasons of record.

The rejection regarding the phrase "transfected/transduced" is withdrawn because it has been deleted.

The phrase "chondrocyte cells chondrocytes" in claim 1, b), third line, is indefinite.

The scope of transfecting chondrocytes with a vector and obtaining any transfected connective tissue cells in claim 13, step b), does not make sense.

Art Unit: 1632

Especially in view of the phrase "chondrocyte cells chondrocytes" in claim 13, step c), second line, which appears to be a typographical error. Assuming step c should be "injecting a composition comprising the transfected population of chondrocytes," the population of cells at the end of step b should be the same as the population of cells at the beginning of step c, i.e. "transfected chondrocytes."

Double Patenting

Claims 1-5 and 13-15 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-11 of U.S. Patent No. 6,797,703, application number 09/702,718. Although the conflicting claims are not identical, they are not patentably distinct from each other because they overlap in scope. The claims of the instant application require regenerating connective tissue by transfecting chondrocytes with a viral or plasmid vector encoding TGF- beta1 or BMP and transplanting the cells by intraarticular injection into an osteoarthritic joint space of a mammal. The claims of '718 require generating hyaline cartilage by transfecting chondrocytes with a viral or plasmid vector encoding TGF- beta1 and transplanting the cells by into the joint space of a mammal. Upon review of the disclosure of '718, the claims in this application could have been claimed during prosecution of '718.

Applicants argue the filing date of 09/702718 and of the instant application are the same. Applicants' argument is not persuasive. 09/702718 was filed 11-1-00 while the instant application was filed 11-8-00.

Claim Rejections - 35 USC § 103

The rejection of claims 1-5 and 13-15 under 35 U.S.C. 103(a) as being unpatentable over Naughton (US Patent 5,842,477, Dec. 1, 1998) in view of Ikeda (Sept. 1998, J. Rheumatol., Vol. 25, pages 1666-1673) and van Beuningen (Sept. 1998, Osteoarthritis and Cartilage, Vol. 6, pages 306-317) has been withdrawn because the references do not teach transplanting cells without scaffolding as newly amended (see also the final office action sent 1-24-03, pg 9).

Conclusion

No claim is allowed.

Inquiry concerning this communication or earlier communications from the examiner should be directed to Michael C. Wilson who can normally be reached at the office on Monday, Tuesday, Thursday and Friday from 9:30 am to 6:00 pm at 571-272-0738.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to (571) 272-0547.

Patent applicants with problems or questions regarding electronic images that can be viewed in the Patent Application Information Retrieval system (PAIR) can now contact the USPTO's Patent Electronic Business Center (Patent EBC) for assistance. Representatives are available to answer your questions daily from 6 am to midnight (EST). The toll free number is (866) 217-9197. When calling please have your application serial or patent number, the type of document you are having an image problem with, the number of pages and the specific nature of the problem. The Patent Electronic Business Center will notify applicants of the resolution of the problem within 5-7 business days. Applicants can also check PAIR to confirm that the problem has been corrected. The USPTO's Patent Electronic Business Center is a complete service center supporting all patent business on the Internet. The USPTO's PAIR system provides Internet-based access to patent application status and history information. It also enables applicants to view the scanned images of their own application file folder(s) as well as general patent information available to the public.

For all other customer support, please call the USPTO Call Center (UCC) at 800-786-9199.

Art Unit: 1632

If attempts to reach the examiner are unsuccessful, the examiner's supervisor, Ram Shukla, can be reached on 571-272-0735.

The official fax number for this Group is (571) 273-8300.
